

Quality Statement

Storage and Handling

To maintain quality, Duty Free Terpenes (DFT) products must be handled and stored in accordance with the following best practices.

DFT products are supplied flushed with an inert gas to preserve product integrity and minimize oxidative degradation. Upon opening, if the entire contents of the bottle are not used, the container should be promptly re-flushed with an appropriate inert gas before resealing to limit oxygen exposure.

The product must be protected from light at all times, with particular emphasis on avoiding exposure to ultraviolet (UV) light, which may adversely affect stability.

Duty Free Terpenes should be **stored under refrigerated conditions at a controlled temperature between 2–8 °C**. Adherence to these storage and handling conditions is essential to preserving the chemical integrity, sensory profile, and overall quality of the product throughout its intended shelf life.
